# Projeto de Comunicações Móveis

## **Vítor Gabriel Lemos Lopes**

<sup>1</sup>Departamento de Engenharia de Comunicações-UFRN

Resumo. Este Trabalho foi feito com intuito de aprendizado adaptação de enlace e conhecimento sobre Long Term Evolution(LTE), Mapeando as possíveis taxas de transmissão dada uma SINR. Para isso foi utilizado a linguagem de programação em Python para a modelagem dos possíveis valores de SINR, com isso foram feitos gráficos para comparação entre o Release 8 e 10 do 3GPP.

### 1. Introdução

Nos sistemas do 3GPP, cada um tem sua forma de calcular taxa de transmissão, aqui abordaremos sobre o LTE(Long Term Evolution), ou também conhecido como 4G. Para poder calcularmos a taxa de transmissão, precisamos saber quem é MCS(Modulation and Coding Scheme) que é quem quem vai mapear a modulação e a taxa de codificação, e o MCS é mapeado de acordo com a CQI(Channel Quality Indicator), que para cada faixa de SNR temos um CQI diferente, e a SNR é dada por cada usuário, e para ficar com uma melhor throughput, para isso usamos essa tabela: [CQI]

CQI index	Modulation	Coding rate	Spectral efficiency (bps/Hz)	SINR estimate (dB)
1	QPSK	0.0762	0.1523	-6.7
2	QPSK	0.1172	0.2344	-4.7
3	QPSK	0.1885	0.3770	-2.3
4	QPSK	0.3008	0.6016	0.2
5	QPSK	0.4385	0.8770	2.4
6	QPSK	0.5879	1.1758	4.3
7	16QAM	0.3691	1.4766	5.9
8	16QAM	0.4785	1.9141	8.1
9	16QAM	0.6016	2.4063	10.3
10	64QAM	0.4551	2.7305	11.7
11	64QAM	0.5537	3.3223	14.1
12	64QAM	0.6504	3.9023	16.3
13	64QAM	0.7539	4.5234	18.7
14	64QAM	0.8525	5.1152	21.0
15	64QAM	0.9258	5.5547	22.7

Table 7.1 Lookup table for mapping SINR estimate to modulation scheme and coding rate

Figura 1. Mapeando CQI dada SNR

De posse da tabela acima temos só que fazer um mapeamento de CQI em MCS, o qual utilizamos o da patente: [Pat ]

Figura 2. Mapeando MCS em CQI

#### 2. Experimento 1

No primeiro experimento foi pedido para que fosse apresentado as tabelas de taxa de pico através da formula e da tabela, com o mapeamento feito na introdução, conseguimos montar a formula da taxa de transmissão. Sabendo que a banda de 1.4Mhz são 6 PRBs, 3Mhz são 15 PRBs, 5Mhz são 25 PRBs,10Mhz são 50 PRBs e 20MHZ são 100 PRBs[cal]. A formula é:

$$Tput = mimo * prb * cp * 12 * mod * 0.75 * ca * cod/(0.5 * 10^{-3})$$
 (1)

#### O quais:

- mimo=Número de antenas
- prb=Número de prbs
- cp=se é prefixo normal(7) se for estendido(6)
- 12 é o numero de subportadoras
- mod= a modulação usada em  $log_2(Qam)$
- 0.75 é porque 0.25 é a overhead [Ove ]

- ca= é o número dos carrier aggregation, que release 8 é 1.
- cod= a taxa de codificação
- $0.5*10^{-3}$  é o tempo do slot

Com posse do calculo pela formula, só precisamos definir como se calcula pela tabela da norma do 3GPP[3GPP 2009] que é dado por esse site [cal ], que é o valor dos bits do TBS index e o MCS, multiplicado por 1000. Com posse desses dados podemos montar essa tabela para o release 8.

		35 Taxa de transmissão

	Table 2 continued from previous page														
28	lxl	4.20 Mbps	4.39 Mbps	10.50 Mbps	11.06 Mbps	17.50 Mbps	18.34 Mbps	34.99 Mbps	36.70 Mbps	52.49 Mbps	55.06 Mbps	69.99 Mbps	75.38 Mbps	349.95 Mbps	376.88 Mbps
28	2x2	8.40 Mbps	8.78 Mbps	21.00 Mbps	22.13 Mbps	34.99 Mbps	36.67 Mbps	69.99 Mbps	73.39 Mbps	104.98 Mbps	110.11 Mbps	139.98 Mbps	150.75 Mbps	699.89 Mbps	753.76 Mbps
28	4x4	16.80 Mbps	17.57 Mbps	41.99 Mbps	44.26 Mbps	69.99 Mbps	73.34 Mbps	139.98 Mbps	146.78 Mbps	209.97 Mbps	220.22 Mbps	279.96 Mbps	301.50 Mbps	1.40 Gbps	1.51 Gbps
28	8x8	33.59 Mbps	35.14 Mbps	83.99 Mbps	88.51 Mbps	139.98 Mbps	146.69 Mbps	279.96 Mbps	293.57 Mbps	419.93 Mbps	440.45 Mbps	559.91 Mbps	603.01 Mbps	2.80 Gbps	3.02 Gbps

Como podemos ver as duas tabelas são bem parecidas, a única diferença é o *carrier aggregation* no release 10 que foi representado pela banda de 100 Mhz que é 5 vezes a banda de 20Mhz.E o mimo 8x8 que é 8 vezes a taxa de transmissão enquanto o release 8 o máximo é mimo 4x4 que é 4 vezes.

## 3. Experimento 2

No experimento 2 foi pedido para que fosse mostrado a REM(*Radio Environment Map* da SINR(*Signal-to-interference-plus-noise ratio* em um mapa com 7 erbs de raio 500m e de frequência 1900Mhz, para o calculo da SINR foi usado a formula:[SIN]

$$\frac{sinal}{interferencia + ruido} \tag{2}$$

Com isso podemos mostrar a imagem a seguir:

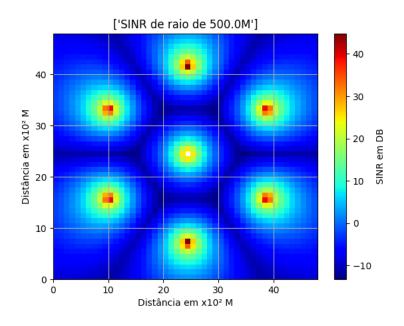

Figura 3.

Também foi pedido para mostrar o Gráfico das CDFs da SINR ,Taxa de transmissão e *throughput* para o melhor caso do LTE, que é a banda de 20MHZ e mimo 4x4. Com isso conseguimos mostrar para os raios especificados de 50,100,500 e 1000 metros:

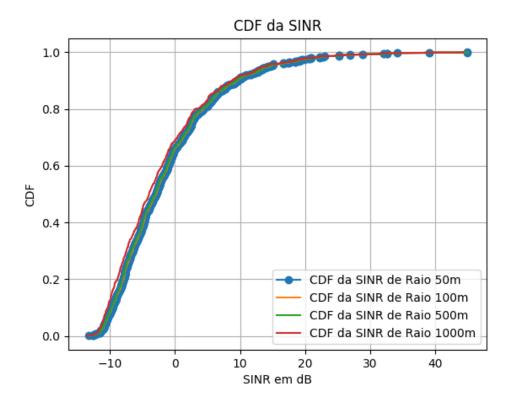

Figura 4. CDF SINR

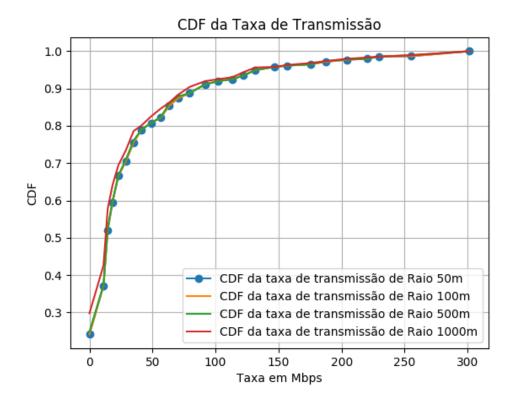

Figura 5. CDF da taxa de transmissão

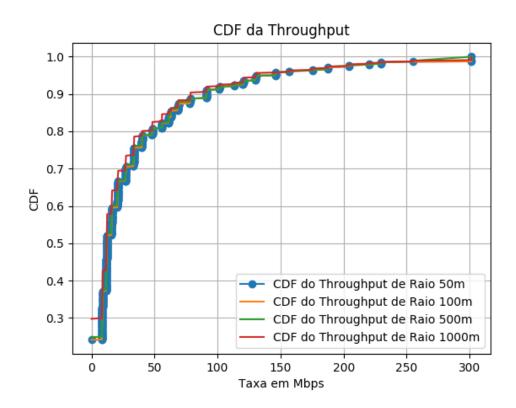

Figura 6. CDF do Throughput

Os pontos em azul foram usados para diferenciar as CDFs de raio 50 e 100, porque estavam em cima do outro.lembrando que o Throughput é calculado com:

$$Tput = TaxTrans * (1 - BER)$$
(3)

E a BER é calculada de acordo com a modulação que o MCS usa, e a SNR efetiva que é 90% da SINR dada, e conseguimos calcular a BER pela formula para modulações M-QAM para quando  $log_2(M)$  é par [Lathi 2009]:

$$Pe = \frac{4}{\log_2(M)} * (1 - \frac{1}{\sqrt{M}}) * Q\left(\sqrt{\frac{3 * \log_2(M) * Eb/No}{M - 1}}\right)$$

(4)

Com os gráficos em mãos podemos perceber que quanto maior o Raio maior a quantidade de pontos com uma SNR, taxa de transmissão e *throughput* mais baixa. E na taxa de transmissão e throughput podemos ver que cerca de 20% estão com 0Mbps isso é porque dada SNR 20% estão fora da área de cobertura das ERBs. E quanto menor o Raio mais se concentram com MCS mais altas, fazendo assim uma maior taxa de transmissão.

Também foi pedido para que fosse mostrado as CDFs para os melhores e piores casos do Realease 8 e Release 10, foi escolhido o raio de 500m para mostrar e temos o seguinte:

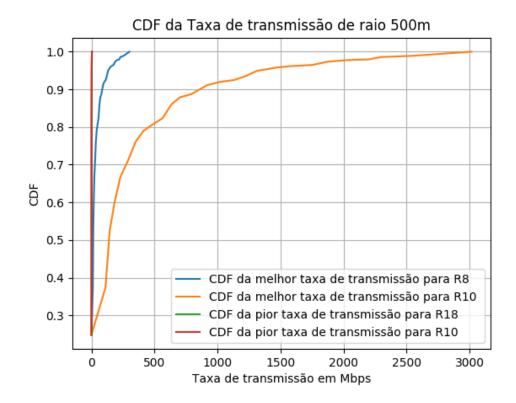

Figura 7. CDF da Taxa de Transmissão para melhores e piores casos

Como para os piores casos tem uma banda apenas de 1.4 Mhz,mimo 1x1 e prefixo cíclico estendido, e o melhor caso do release 10 tem 100Mhz de banda, mimo 8x8 e prefixo cíclico normal, é possível notar uma grande diferença a taxa de transmissão é cerca de mil vezes maior ou mais,por isso fica proximo do 0, e para o release 8 no melhor caso com 20Mhz de banda e mimo 4x4, podemos ver que chega apenas a 300Mbps, 10 vezes menos que a do release 10. Em comparação aos gráficos anteriores de gráficos o raio das ERBS não é um fator que faz tanta diferença em comparação com a quantidade de banda e mimo.

Também foi pedido para que fosse mostrado as CDFs do *carrier aggregation* do release 10 e o melhor caso do release 8 com mimo 1x1 e prefixo cíclico normal. Com isso temos a imagem seguinte

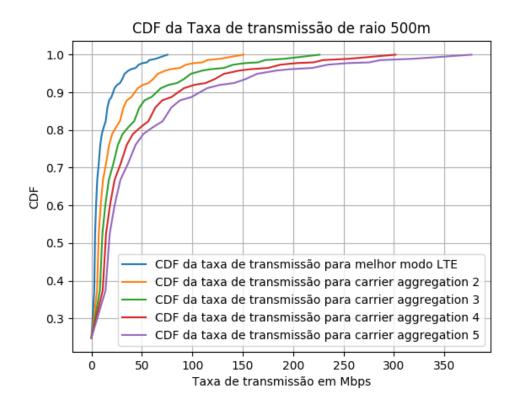

Figura 8. CDF da Taxa de Transmissão para Carrier aggregation

Com essa imagem conseguimos perceber que quanto maior o carrier aggregation maior a taxa de transmissão, e quanto a comparação com vários raios, as condições dos parâmetros são os mesmos de calcular é a taxa de transmissão que na de varios raios elas terminam no mesmo ponto, já essa do carrier aggregation não.
